(57) Abstract: Disclosed is a method of loading data, such as software, into a mobile terminal, where the data is loaded from a loading station, and the data comprises payload data and header data. The mobile terminal accepts the data conditioned on a verification process based on the header data. The step of receiving the data further comprises the steps of receiving a header message including the header data from the loading station by the mobile terminal, verifying the received header data by the mobile terminal, and receiving at least a first payload message including the payload data, if the header data is verified successfully.
